

The Brilliant But Forgetful Builder

Imagine a master engineer who works at lightning speed, knows every tool, and never tires. There's just one catch: every single morning, they wake up with total amnesia.

EVERY MORNING IS DAY ONE

Without a memory, brilliant agents are blank slates the moment a session ends. They re-read the the same files, re-discover the same structures, and re-try approaches you already proved don't work. The first twenty minutes of every session is spent just getting back to yesterday.

The Cost of Amnesia vs. The Magic of Memory

The Cost of Amnesia

The Magic of Memory

Working without memory costs time (re-starting cold), money (paying for tokens to re-read files), and lost reasoning. Memory turns wasted effort into compounding progress.

Meet the Little Note-Taking Friend

You don't need to make the main agent remember. You just need an observer—a second agent whose only job is to sit quietly, watch the builder work, and write down the parts worth remembering.

Working Together, Side-by-Side

The Builder takes an action.

The Friend watches closely.

The Friend decides if it's worth a note.

Claude-Mem catches every action the agent takes (reading, editing, running commands) in the background. It never interrupts. The main agent is never slowed down waiting for the observer.

Catching Only the “Aha!” Moments

A notebook full of trivia is useless. The Friend is deliberately selective.

Reading a file to check something trivial? No note.

Fixing a bug or making a key architectural decision?
A structured note is born.

The Perfect Shape of a Memory

The observer doesn't write a messy diary. It writes highly structured, predictable observations. This shape is the magic that makes memories searchable and cheap to hand back.

A Tiny Scroll to Start the Day

If the Friend handed back every note in full, it would blow the budget instantly. Instead, every new session starts with a compact timeline of recent titles. The Builder skims the titles and wakes up warm.

Digging Deeper in the Archives

Fetch by ID

Semantic Search

Titles first, details on demand. If a title looks relevant, the Builder asks for the specific folder (Fetch by ID). For older mysteries, the Builder can ask the Friend to search the entire semantic history.

Playing Dress-Up to See New Worlds

Code Mode

Transcript & Chat Mode

Photo Mode

The observer's job description is swappable. By changing a simple configuration file (a 'Mode'), the Friend can stop watching code and start taking structured notes on whiteboard photos, meeting transcripts, or chat logs. Any data in, any pattern out.

A Workshop Full of Building Blocks

Because the pieces are simple and exposed, they are perfect for building. Wire the timeline into your editor, use search to build a new UI, or trigger real-time actions the moment the Friend writes down a specific pattern.

Build an agentic tool that actually remembers.
Bring your own idea, build an integration, or
create a custom Mode. Over 100,000
100,000 developers are already using it.
