

Win the \$1,000 Claude-Mem Prize

Build an agentic tool that actually remembers.

One agent builds, the other takes the notes.

1. Main agent does the work

2. Observer watches every move

3. Only saves what matters

Your mission is to make memory matter.

**Infinite
Context Window**

**Prompt
Stuffing**

**Meaningful
Memory**

The Rule: We don't want just a bigger context window or a prompt stuffed with everything.

The Goal: Build a tool that keeps what's important, finds it instantly, and makes your AI smarter than it was yesterday.

The Path: Pick one of the next 7 blueprints, mix them up, or invent your own!

Blueprint 1: Skip the amnesia and give your agent a warm boot.

The Cold Start

Turns to useful = 10

Don't let your agent burn its first ten turns rediscovering the codebase.

The Warm Boot

Turns to useful = 1

Build an agent that opens with instant context. Measure the difference: how many turns did the cold version need versus yours? Show us the math!

Blueprint 2: Build a new world on top of the timeline

The timeline is a stream of searchable, structured notes with specific IDs.

Anchor on any single moment in time and read what happened right around it using semantic and keyword search.

If you had this beautiful, filterable timeline as your database, what new retrieval layer would you build?

Blueprint 3: Give the CLI skills a beautiful face.

```
> cli_process_initiated  
> memory_dump_raw  
> context_retrieval_status: active  
> output_format: raw_text  
> _
```

Right now, the skills in the repo are text-in, text-out. Wrap them in magic!

Context Window

Memory Depth

Urgent

UI

Core

Share Memory

Build a dashboard, browser extension, or mobile view. Make memory something we can see, steer, and share with teammates.

Blueprint 4: Wire memory directly into where the work happens

- ✓ Memory is most valuable where developers are already living.
- ✓ Wire Claude-Mem into places it doesn't exist yet: your favorite editor, your CI pipeline, your chat app, or another agent framework.
- ✓ Bring the observer to the work!

Blueprint 5: Ingest anything, find every pattern

1

Observations aren't just text!
Feed the observer screenshots, design files, whiteboards, or robot logs.

2

The observer's job description is swappable. Any data in, any pattern out.

3

Pro-Tip: Just use ``/mode-creator`` — it will interview you and automatically write the custom mode to tell the observer exactly what to watch for.

Blueprint 6: Build agents that fire on what they see.

1

Don't just store memories—
react to them in real time!
Hook actions directly to
observations.

2

See a security note? Ping
the chat channel. See a
decision? Open a ticket.

3

See the same error three
times? Escalate it instantly.
Build agents that act instead
of waiting to be asked.

Blueprint 7: Use memory as the ultimate speed play.

Massive Context Window Processing

Titles-First Recall

- Use smart recall to cut down on tokens, turns, and wall-clock time.
- Fetch the titles first, grab the heavy details by ID only when needed.
- The titles-first recall pattern already reports ~99% savings in startup context. Push it further, measure it, and show us the numbers!

The Tiebreaker: The Monday Morning Test.

The Ultimate Question: Would someone actually use it?
Everything scores extra for solving a real need over an imaginary one.
A polished demo of a tool you would legitimately fire up this coming Monday morning to do your own work will always score big and break any ties.

The Bounty: \$1,000 Cash

Take home the bag! The Claude-Mem prize is judged completely separately from the overall 1st–3rd place hackathon prizes. That means you can double-dip: win the memory prize **AND** the main event!

Equip your inventory and get set up.

Step 1: Grab your 30 days of CMEM Pro free! Go to **cmem.ai** and use code **FASTHACK30**.

Step 2: Type the magic spell in your terminal:
npx claude-mem install

Step 3: Bookmark the goods and skills:
github.com/thedotmack/claude-mem

The Aha Pro-Tip: Install it, do one quick session of work, start a second session, and look at the timeline at the top. Open the viewer and watch the notes land live. You'll "get it" instantly. Happy hacking!
